## English translation of Abstract of EP 0 418 773

A dimensionally stable laminate 1 has the form of a flat or curved panel, which comprises a number of superposed, pressed-together thermoplastic films 5', 5'', 5''' ..., which are coated at least on one side with a sealing layer 10. Each of the plastics films is monoaxially and/or biaxially stretched. Some of the plastics films forming the laminate have perforations 7', 7'', 7''' .... The perforated plastics films are superposed in such a way that the perforations are congruent or offset from one another.

In addition to the perforated plastics films, there may be full-surface homogeneous plastics films without perforations in the laminate. The perforated and the full-surface plastics films are then superposed in such a way that the perforations are offset from one another.
